Fuzzy logic presents many potential applications for modelling and simulation. In particular, this paper analyses fuzzy linguistic representation model with one of the most popular fuzzy logic techniques for computing with words [4, 2]. We will formalize the way people make conclusions on basis of linguistic description which is a set of fuzzy *if-then* rules understood as natural language expressions [1]. A model presented here is based on automated method given in [3].

The research of the first author is supported by the Science Fund of the Republic of Serbia, Grant no 7750185, Quantitative Automata Models: Fundamental Problems and Applications - QUAM.
